

YOUNG PEOPLE: THE UNTAPPED RESOURCE FOR DEVELOPMENT

Thematic Series

*Based on the National Population
and Housing Census 2014*

November 2017

GOVERNMENT OF UGANDA

YOUNG PEOPLE: THE UNTAPPED RESOURCE FOR DEVELOPMENT

Thematic Series

Based on
the National Population and Housing Census 2014

Uganda Bureau of Statistics
Kampala, Uganda

November 2017

FOREWORD

The utility of statistics for policy formulation, decision-making, monitoring and evaluation of socio-economic development programmes and projects has long been recognised in Uganda. There is also increase in the demand for statistics in the country, including indicators to inform progress in National and International agenda like the National Development Plan II (NDP II), Agenda 2063 among others. To respond to this demand, the Bureau has over the years developed systems to facilitate the production of statistics through the conduct of censuses, surveys and compilation of data from administrative sources. As the coordinator of the National Statistics System, the Bureau has also together with its stakeholders in the National Statistical System (NSS)

developed a National Standard Indicators (NSI) Framework that contain a list of indicators that will be closely produced over time.

The 2014 Population and Housing Census was the fifth census to be undertaken in Uganda since independence in 1962. The broad objective of the 2014 National Population and Housing Census (NPHC) was to ensure the availability of demographic, housing and socio-economic bench-mark data at the national and sub-national levels for planning. Beyond providing benchmark data for planning, detailed analysis of the census will enhance understanding of the effectiveness of the various interventions initiated by Government and its partners in improving the lives of Ugandans.

To facilitate analysis in the report the districts have been grouped into 15 sub-regions with similar characteristics. The sub-regions are Kampala, Central1, Central2, Bukedi, Busoga, Elgon, Teso, Karamoja, West Nile, Lango, Acholi, Ankole, Kigezi, Bunyoro and Toro. An attempt has also been made to present the patterns of the findings by background characteristics including by rural/urban residence, the 15 sub-regions, sex, and wealth status among others. When presenting the household characteristics the differentials were presented by selected socio-economic characteristics and the sex of the head. In showing the spatial patterns and differentials, information is presented by the Uganda's 122 Districts as at 1st July 2017.

Comparison with the results from the earlier censuses, some trend analysis has been undertaken in the report contrasting the 2014 Census indicators with those released under previous censuses. However, with the ever changing rate of the administrative set up of the country, it was not possible to make this comparison below District level.

In order to support the planning process, the results from the Census 2014 are being released in phases as and when they become available. The Provisional Results Report was released in November, 2014 followed by the Final Results Report which was released in March 2016. The Sub-County Reports were

releases in June 2016 and the Area Specific Profile Series in July 2017. These reports collectively provided information on the characteristics of the population and households at the national and sub-county levels.

In addition to this Report on Yong People, the sister Thematic Reports and the other reports mentioned above that have already been published, the Bureau will be producing the following:

- (i) The Census Administrative Report
- (ii) Census Atlas
- (iii) Post Enumeration Survey Report

UBOS wishes to express its gratitude to all stakeholders and Development Partners (UK AID, UNFPA, UNICEF).

The value of statistics is appreciated on its use, the Bureau, therefore appeals to all stakeholders to use the information contained in this and other census reports to inform policy and decision making so as to benefit the whole public.

Together We Count

Ben Paul Mungyereza
EXECUTIVE DIRECTOR

PREFACE

Uganda aspires to reach upper-middle income status by 2040, with an expectation of improving the wellbeing of its citizens and a per capita income of USD 9,500. Studies have shown that for this to happen, investments must be made to improve the wellbeing and the productivity of Uganda's adolescents and youth who comprise of Uganda's biggest population. According to the 2014 Census, 78 percent of Uganda's population are below 30 years. However, this monograph indicates that for many adolescents and youth in Uganda, their potential to lead economic and social change has not been realised.

According to this report, the working population of adolescents and youth below 30 years is below 65 percent for those in rural areas. Therefore, investments in creation of jobs and improved opportunities for entrepreneurship and profitable self-employment for the rapidly expanding youth labour force is critical for Uganda's desire of becoming a middle income country.

Over 75 percent of Uganda's youth are engaged in vulnerable work, often characterised by inadequate earnings, low productivity and difficult conditions of work that undermine workers' fundamental rights. It is therefore important that Government of Uganda puts in place initiatives to address such vulnerabilities in order to realise the full potential of young people.

Uganda's labour force must be well educated and endowed with high quality skills that will make the country competitive in the global market. In order to achieve this, investments must be made in improving school completion and transition rates for girls and boys across all educational levels as these are indicated in this report as existing gaps in education.

Furthermore, the report does point to the fact that young girls in Uganda become mothers too early which interrupts their education and future prospects. Therefore, investment in adolescent girls will prove particularly beneficial to Uganda, as it is associated with reduction in school dropout, child marriage, teenage pregnancy and improved sexual and reproductive health. Girls with access to and control over economic resources are more likely to invest in their families.

It is my hope therefore, that the data in this report will be used by all sectors in Uganda to guide decision making and policy advancement for improving the wellbeing and productivity of Uganda's youthful population.

CHAPTER ONE:

INTRODUCTION

1.1. Overview

Achieving a faster socio-economic transformation will depend on the country's capacity to strengthen the fundamentals for exploiting the youthful population and thus harnessing the demographic opportunity for development. This can be achieved by turning the young population into a productive human capital that contributes to the economic growth of the country.

With over 20 percent of its population aged between 15 and 24 years, Africa is the most youthful continent in the world (UNECA, 2010). The continent has therefore dedicated the decade 2009-2018 to youth development. It has also developed a roadmap to harness demographic dividend while African heads of state and governments have dedicated the year 2017 to the theme: Harnessing the Demographic Dividend through Investment in the Youth (African Union, 2011).

While young people are central to the demographic dividend, they have not been sufficiently sensitized and engaged in national and regional efforts towards harnessing the demographic dividend in Africa. This could be attributed to the multiplicity of definitions of who a youth is as per the various countries.

In as much as it is timely and befitting that programs aimed at adolescent and youth empowerment are strengthened and more investments made, it is even more critical that investments are made in understanding the youth, their attitudes, experiences and practices regarding sexual and reproductive health as well as their perceptions, tastes and preferences of the economic activity, social, cultural and political environments.

The focus of this monograph is therefore on young people (10-30 years) with particular attention to their demographic and socio-economic characteristics changes, according to statistics from the 2014 population census. It is derived from already published data and a range of special tabulations produced.

Definitions

Young people	10 to 30 years
Adolescents	10 to 19 years
Teenagers	12 to 19 years (for tracking teenage pregnancy)

Youths

International definition	15 to 24 years
National definition	18 to 30 years
EAC community	15 to 35 years
Kenya	18 to 35 years
Burundi	15 to 35 years
Tanzania	15 to 35 years
Rwanda	14 to 35 years
Uganda	18 to 30 years

In order to cater for different stakeholders, data was tabulated by different age groups for completed years between 10 and 35 years. Therefore, given the multi-stakeholders' requirements, the report provides information in line of the known standard definitions of young persons, adolescents and youths.

1.2. About the National Population and Housing Census 2014

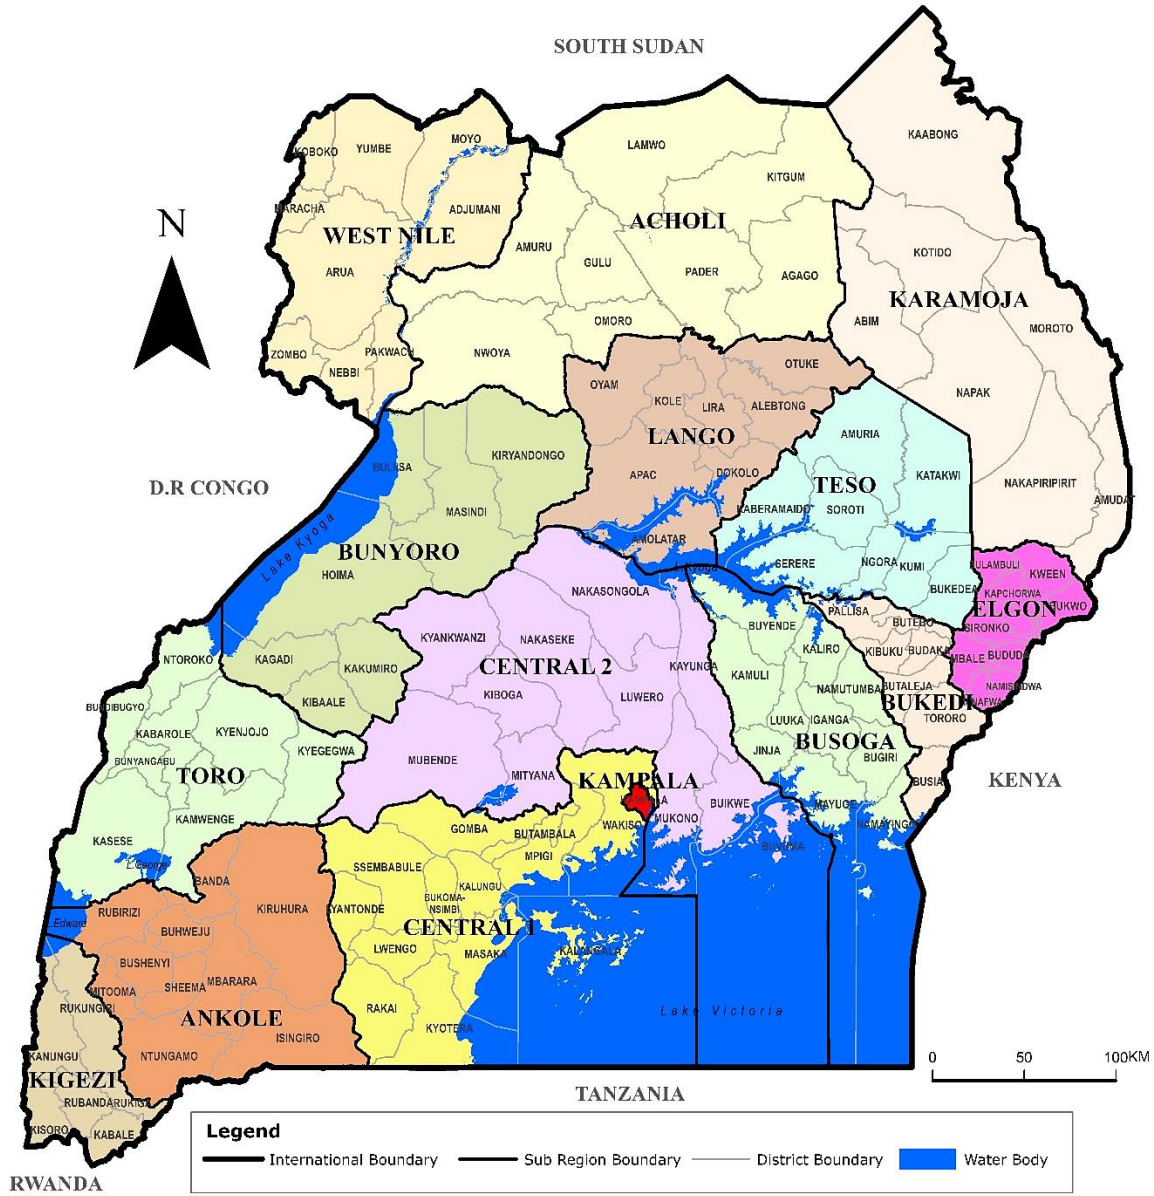

The overall objective of the National Population and Housing Census 2014 was to provide data that are required for planning at all levels. The NPHC 2014 had three distinct phases - the Preparatory Phase, the Enumeration Phase and the Post Enumeration Phase.

The final results of the NPHC 2014 were published in a phased manner. The publications included 1) Provisional Results; 2) Final Results (National & Local Government Level); and 3) Analytical Results with different monographs including this about the young people. The Provisional Census Results were compiled from enumeration area summary sheets. The Provisional Results were disseminated in November 2014. These gave the number of households and the population by sex for administrative areas down to sub-county level. The first set of the final results of the Census 2014 were published in the Main Report which was released in March 2016. The report included information on the population size and distribution as well as characteristics of the population and the dwellings they live in.

The monograph about the young people presents detailed findings covering indicators on different aspects of the young population. Most of the findings have been disaggregated by sex, residence and sub-regions. District groupings into the 15 sub-regions are as follow;

- **Central 1:** Butambala, Gomba, Mpigi, Bukomansimbi, Kalangala, Kalungu, Lwengo, Lyantonde, Masaka, Rakai, Sembabule, Wakiso, Kyotera
- **Central 2:** Buikwe, Buvuma, Kayunga, Kiboga, Kyankwanzi, Luwero, Mityana, Mubende, Mukono, Nakaseke, Nakasongola
- **Kampala:** Kampala
- **Busoga:** Bugiri, Namutumba, Buyende, Iganga, Jinja, Kaliro, Kamuli, Luuka, Mayuge, Namayingo
- **Bukedi:** Budaka, Butaleja, Kibuku, Pallisa, Tororo, Busia, Butebo
- **Elgon:** Bulambuli, Kapchorwa, Kween, Bududa, Manafwa, Mbale, Sironko, Bukwo, Namisindwa
- **Teso:** Amuria, Bukedea, Katakwi, Kumi, Ngora, Soroti, Kaberamaido, Serere
- **Karamoja:** Abim, Amudat, Kaabong, Kotido, Moroto, Nakapiripirit, Napak
- **Lango:** Alebtong, Amolatar, Dokolo, Lira, Otuke, Apac, Kole, Oyam
- **Acholi:** Agago, Amuru, Gulu, Lamwo, Pader, Kitgum, Nwoya, Omoro
- **West Nile:** Adjumani, Arua, Koboko, Maracha, Moyo, Nebbi, Yumbe, Zombo, Pakwach
- **Bunyoro:** Buliisa, Hoima, Kibaale, Kiryandongo, Masindi, Kagadi, Kakumiro
- **Toro:** Bundibugyo, Kabarole, Kasese, Ntoroko, Kyenjojo, Kamwenge, Kyegegwa, Bunyangabu
- **Kigezi:** Kabale, Kisoro, Kanungu, Rukungiri, Rubanda, Rukiga
- **Ankole:** Buhweju, Bushenyi, Ibanda, Isingiro, Kiruhura, Mbarara, Mitooma, Ntungamo, Rubirizi, Sheema

Map of Uganda showing the 15 Sub-regions

CHAPTER TWO:

POPULATION SIZE, AGE AND SEX STRUCTURE AMONG YOUNG PEOPLE

Key Findings

In 2014, the total population was 36.4 million of which the population of young people (10-30 years) was 26.8 million (a proportion of 44 percent) . The adolescent population (10 -19 years) was 8.9 million (26 percent) while the youth population (18-30 years) was 7.8 million (23 percent).

The proportion of youth who were urban residents (32 percent) was higher than the national proportion of 24 percent. The young people migrate more to the urban areas as they grow older. With availability of education, family planning services and employment opportunities, an urban centre where the deterrent factors of teenage pregnancy, crime, disease, corruption, pollution, unplanned housing units and poor drainage systems are dealt against, there would be high prospects of realising demographic dividend.

2.1. Introduction

To plan and formulate present and future development programmes, a country needs to know the size, quality and growth rate of its population. Population growth should be in tandem with the pace of economic growth if a country is to develop fast enough. For a country to join the pathway to attaining a demographic dividend, the country should not only develop fast enough but also realise accelerated economic growth where everyone within the population has an opportunity to realise their full potential. Population censuses are the main sources of demographic data in general and of population size, distribution and growth information in particular. Other sources may include the Birth and Death Registration System (BDR) and administrative records. Although the BDR system is in operation, it is currently not comprehensive enough to generate reliable estimates.

Information about the country's population size, growth and distribution are critical statistics that enable governments to make informed decisions, effectively plan and monitor development progress. A good understanding of population trends and distribution is essential in assessing future developments and service delivery.

2.2. Size and distribution of the adolescents, and youth population

The results in Table 2.1 presents the indicators of the different sub-groups for population censuses from 1969 to 2014. With regard to age structure, the adolescent population (10-19

years) constituted 26 percent of the total population, while the youth (18-30) constituted 22 percent of the total population.

The adolescent population (10-19 years) grew from 6.2 million in 2002 to 8.9 million in 2014, an increase of nearly 225,000 people every year, representing an annual growth rate of 3.0 percent. On the other hand, the youth population (18-30 years) grew from 5.5 million in 2002 to 7.8 million in 2014, an increase of nearly 2.3 million over a 12 year period, representing a similar growth rate of 3.0 percent. This proportion of the population is also a primary target for Uganda's chances of realising a demographic dividend. This can however happen only if the right investments are made rightly and timely. Such investments, as detailed in this report, include quality education, demand and access to family planning services as well as a conducive environment for innovation and productivity.

Table 2.1: Population size and distribution among young people

Age groups	Population				Proportion to total population				Inter-census growth rate
	1969	1991	2002	2014	1969	1991	2002	2014	
10-17	1,590,580	3,301,630	5,162,788	7,354,325	16.7	19.8	21.1	21.2	2.9

Total population (Uganda)	9,548,847	16,671,705	24,442,084	34,634,650	100	100	100	100	3.0

2.3. Gender Distribution of young people, by age group

Age and sex are two attributes that largely influence an individual's role in a society. They are the basic characteristics or biological elements, of any demographic group and affect not only its demographic features but also its socio-economic and political structure. These influence fertility and mortality, migration, marital status, and economic activity status. These attributes are also essential as they guide in identifying a citizen's contribution towards the development aspirations of a country. Choices made by either male or female persons at any given age may either deter his life's chances and the chances of his/her economy to attain the development and dividend dreams.

Across all age groups, the population of the females were higher than that of males as shown in Table 2.2. In Uganda, a girl child's choice at the age of 10 may result in early marriages, teenage pregnancies and shatter the demographic dividend roadmap. On the contrary, if a 10-year-old girl

child opted for the right choices of staying in school and delaying marriages and pregnancies, then they will be an asset and light up the demographic dividend roadmap.

Table 2.2: Distribution of Young people by age groups

Age groups	Male Number	Male Percent	Female Number	Female Percent	Total Number	Total Percent
10-17	3,670,917	49.9	3,683,408	50.1	7,354,325	100
10-19	4,380,586	49.3	4,496,490	50.7	8,877,076	100
18-30	3,571,295	45.8	4,233,937	54.2	7,805,232	100
Other age groups						100
10-24	5,825,024	48.3	6,240,663	51.7	12,065,687	100
15-19	1,917,797	48.5	2,038,836	51.5	3,956,633	100
15-24	3,362,235	47.1	3,783,009	52.9	7,145,244	100
15-35	5,625,414	46.8	6,392,869	53.2	12,018,283	100

2.3.1. Sex composition of young people

The sex composition of the human population is one of the basic demographic characteristics, which is extremely vital for any meaningful analysis. It is dependent on past population dynamics trends of fertility, mortality and migration.

Sex ratio, which is the number of males per 100 females among the population, is an indicator used to measure the extent of prevailing parity between males and females. A sex ratio above 100 indicates that there more males than females. In normal populations, the overall sex ratio of a population is expected not to vary greatly from 100.

Figure 2.1 shows that in 2014, the sex ratio of young people (10-30 years) was 92 percent with high proportion of females across all the young person's age groups indicated by sex ratios below 100 but declining with increasing age. This reflects the fact that at older ages, males tend to die faster than their female counterparts and hence producing a sex ratio below 100. It also inspires investment in girls at an early age to ensure that their longevity is not a nightmare for them, their benefactors and their future generations. The earlier girls are prepared to delay sex, marriage and pregnancy, the better their future and that of the country. On the other hand, the fact that males tend to die faster calls for a deliberate strategy to ensure their longevity just as much as the females.

Figure 2.1: Sex ratios of the young people

Table 2.3 presents the age specific sex ratio among adolescents and youths by residence and regions. There was high sex ratio in rural areas than in urban, implying that there were more female adolescents and youths in rural areas than in urban areas. The settings of an urban area are an essential tool for attaining the demographic dividend but also shattering its attainment. Education, security, family planning and employment opportunities are as many as there are night clubs, bars, brothels, lodges and dark spots. The fact that more young females than males are in the rural areas implies that more of the young females than males are hindered from accessing benefits associated with urban centers, thus exposing them to the social and economic risks that may shatter their demographic dividend attainment.

At the sub-regional levels, sex ratios varied for the adolescents. Kampala had the lowest sex ratio of while Central2 and Bunyoro had the highest. However, although the sex ratios for the youth were different, they were all below 100 for all regions implying more females than males.

Note: Population in '000

2.4. Distribution of the adolescents and youth population

Population distribution refers to the way people are spread over a specified geographical area. The distribution of the young persons' population by sub-regions in 2014 is shown in Table 2.4. Central 1 sub-region had the highest concentration of adolescents and youths across all the selected age groups of young persons while Karamoja had the least population.

The proportion of the adolescents in urban areas was 23 percent while that of the youth was 32 percent as compared to the overall urban population which was 21 percent of the total population. This indicates that there were more young people 10 to 30 years in urban areas. The pattern indicates that as the young people grow older, many move to the urban areas. If well planned and structured, an urbanised community is a great engine for the empowerment of a country's human resource.

2.5. Migration of the adolescents and youth

Migration is the movement of people across a specified boundary for the purpose of establishing a new residence. Migration may be internal (within the country's boundaries) or international (across country boundaries). However, this section considers regional migration between the different statistical sub-regions as presented in Table 2.5.

The results in Table 2.5 shows that nationally, the proportion of the youth (18-30 years) that migrated across the sub-regions was 20 percent as compared to 11 percent of adolescents (10-19 years). The proportion was higher for females than males irrespective of the age group of young people. The results further indicate that the proportion of the rural young population that migrated was more than twice that of the urban residents irrespective of the age group. Young population living in Kampala were more likely to have migrated compared to other sub-regions, while those living in Lango sub-region were less likely to have migrated to other regions irrespective of the age group. This high share of Kampala is attributed to the urban nature of Kampala City, which attracts in-migrants with the hope of improving their livelihood and getting employment opportunities. Migrants, if well regulated can be an asset to the development aspirations of the receiving as well as the sending areas. It facilitates the transfer of skills and enhances the empowerment of the natives particularly the young people.

Table 2.5: Internal migration of young people, Proportion (Percent)

CHAPTER THREE:

SOCIAL CHARACTERISTICS OF YOUNG PERSONS

Key Findings

Of all households headed by adolescents aged 10 to 19 years, the proportion of single-person households was 39 percent and for the youth aged 18 to 30 it was 19 percent.

Analysis of the marital status of young people indicated that seven percent of the adolescents aged 10-19 years were married while about one percent were widowed/divorced/separated. On the other hand, 56 percent of the youth aged 18-30 years were married, with the proportion of females at 65 percent higher than for males at 44 percent. Across the sub-regions, Bunyoro had the highest proportion of the adolescents (10-19 years) who had ever married (10 percent) while Kampala had the lowest (5 percent each).

The Catholics, Anglicans and Moslems together accounted for more than 80 percent of the total young population aged 10 to 30 years.

3.1. Adolescent and youth-headed households

During the 2014 Census, a household head was defined as the person who was regarded by the members of the household as its head, and could be a man or a woman.

The results in Table 3.1 indicate that 26 percent of the youth (18-30 years) were household heads. The proportion was only one percent for the adolescents aged 10-19 years. The results further indicate that irrespective of age group, the proportion of male young persons who were household heads was more than four times that of their female counterparts. Also, there were more young household heads in urban areas compared to rural areas. Kampala district had the highest proportion of adolescents and youths who were heads of households while Karamoja had the least.

Total	1.4	26.1	6.6	11.1	25.1

3.1.1. Household size of young household heads

The size of the family is a matter of great importance not only for the country as a whole but also for the welfare and health of the individual, the family and the community. Large family size in low developed countries have implications of poor health, inability to provide adequately for the education of the siblings, low standard of living and the inability to fulfil one's dreams.

A household is defined as a group of persons who normally cook, eat and live together irrespective of whether they are related or unrelated. The average household size is a measure of the number of persons who spent the census night in the household. In this case, the size given is as of the census night, which might be slightly different from the mean number of usual members.

The 2014 census indicated a national average Household size of 4.7 persons. Table 3.2 shows that households of young people had widely varying sizes. Among the adolescents (10-19 years), the proportion of single-person households was 39 percent while among the youths, proportion of single-person households was 19 percent. The proportion of adolescent headed households reduced with increasing average number of household members while for the youths the proportion of the heads was higher for larger numbers of household members. The average household size was 2.3 members for all households headed by adolescents and 3.4 for households headed by youths indicating more responsibilities as the young people grow older.

Table 3.2: Household Size of young household heads

Number of household members	10-19	18-30	10-24	15-24	15-35
1	39.1	18.7	27.0	27.0	16.0
2	28.4	17.0	23.7	23.7	14.3
3	17.1	21.8	24.7	24.7	18.6
4	7.2	18.2	13.9	13.9	17.2
5	8.2	24.4	10.7	10.7	33.9
Average Household Size	2.3	3.4	2.7	2.7	3.8

Details of the household size by age groups 18-30, 10-24, and 15-24 by sex, residence and regions can be found in appendix tables 1, 2 and 3 respectively.

3.2. Marital status of young people

Marriage is deemed to be the major gateway to family formation and child bearing. Marriage is defined simply as a union between a man and a woman who see and take each other as husband and wife. This is regardless of whether any formal ceremony has been performed or the length of the union.

The results in Table 3.3 show that about seven percent of the adolescents aged 10-19 years were married while about one percent was widowed/divorced/separated. On the other hand, 56 percent of the youth 18-30 years were married, with the proportion of females at 65 percent higher than for males at 44 percent.

Table 3.3: Marital status of young people

Marital status	10-19			18-30			15-24			15-35		
	M	F	T	M	F	T	M	F	T	M	F	T
Never Married	97.1	86.8	91.9	53.8	27.1	39.2	80.4	52.6	65.6	56.3	34.7	44.7

Marital status by single years according to gender, residence and geographical location are provided in Appendix Tables 4, 5 and 6 respectively.

3.2.1. Married adolescents, youths and young people by place of residence, age and sex

Ever married population includes those currently married/cohabiting, widowed, divorced and separated. Seven percent of the young population aged 10-19 had ever married as indicated in

Table 3.4. The proportion was 56 percent for the youth (18-30 years). The results further indicate that the proportion of females that had ever been in marriage was much greater than that of their male counterparts irrespective of the age group.

Among adolescents (10-19 years), 12 percent of the females had already married compared to only three percent among the males of the same age group. This could be attributed to the fact that girls, especially those in the rural areas where majority are, marry off at an early age compared to boys. The proportion of the ever married rural residents was higher than their urban counterparts for all age groups.

Bunyoro sub-region had the highest proportion of the adolescents (10-19 years) who had ever married (10 percent) while Kampala sub-region had the lowest (5 percent each). Similarly, Bunyoro sub-region had the highest proportion of the youth aged 18-30 who had ever married (62 percent) while Kampala sub-region had the lowest (40 percent).

3.3. Young people 10-30 years by religious affiliation

The findings of the 2014 Census indicate that Catholics are the largest religious denomination constituting

38 percent of the young population age 10-30, followed by Anglicans (31 percent) and Moslems (14 percent). Together these denominations account for more than 80 percent of the total population of young people (10-30 years) as shown in Table 3.5.

3.4. Young people aged 10-30 by Ethnic Composition

Ethnicity is defined as a segment of a society whose members are thought by themselves and /or others to have a common origin and to share important segments of a common culture.

The 2014 Census classified Ugandans into 65 legally recognised ethnic groups existing at the time. Table 3.6 shows that the Baganda was the largest single tribe (17 percent) of the young persons aged 10 to 30 years, followed by the Banyankole with 10 percent. About 29 percent of the young people were Ugandans but did not belong to any of the 65 legally recognised ethnic groups.

Table 3.6: Ethnic composition of young people 10 to 30 years by sex

Ethnic Groups	Male	Female	Total

CHAPTER FOUR:

FERTILITY AND REPRODUCTIVE HEALTH OF YOUNG PEOPLE

Key Findings

Childbearing starts early in Uganda with women aged 15 – 19 years old having a rate as high as 0.160 implying that for every 1,000 females aged 15-19, they have 160 births. Seventeen percent of the teenagers (13-19 years) had already begun child bearing with at least one child, rural teenagers start parenthood slightly earlier than their urban counterparts (18 percent versus 16 percent, respectively). Among the teenagers who had never married, eight percent had ever had child birth. Ten percent of all the young mothers had no formal education while 71 percent had primary education level. In Karamoja sub-region 79 percent of young mothers had no formal education while 17 percent had primary level education.

The disability prevalence rate was 7 percent for the adolescents aged 10-19 years and nine percent for the youth (18-30). Thirteen percent and 12 percent of the disabled adolescents and youth respectively had severe disability.

At community (LC1) level, information was collected about a number services associated with the youth. These youth friendly services normally available in youth centres were not readily available in the communities. About 11 percent of the communities reported availability of counselling services within their communities.

Fertility indicators measure the frequency of childbirth in a given population. Such indicators can tell how fast the population of a given country or region would increase. This information has implications on the country's ability to create a development infrastructure. High fertility coupled with low or declining mortality will lead to a fast growing population.

4.1. Adolescent fertility rate (number of births per 1,000 women aged 15-19 years)

Besides posing challenges to society as a whole, adolescent fertility can have lasting and potentially devastating effects on adolescents themselves. In most African societies, adolescence is a key period, when several crucial events coincide. During their adolescent years, women are likely to terminate their training; leave home; and begin conjugal life, childbearing, and adult work.

Furthermore, adolescent pregnancy and childbearing pose health risks for both mothers and children. In comparison to infants born to older mothers, infants born to very young mothers experience greater risks of prematurity, low birth weight, birth injuries, and mortality.

Young women are more likely than older women to attempt dangerous abortions or suffer damage in the birth process that may render them infertile or endanger their lives. Adolescents who are

active sexually are exposed to serious risk of infection with sexually transmitted diseases, including HIV/AIDS.

The 2014 Census obtained information about the children ever born to women aged 12 – 54 years. There are several indicators used to measure current fertility. However, this section presents Age Specific Fertility Rates (ASFR)

The Age Specific Fertility Rate (ASFR) is the number of births occurring during a given year or reference period per 1,000 women of reproductive age classified in single-or five-year age groups. The ASFR has two primary uses: (1) as a measure of the age pattern of fertility, that is of the relative frequency of childbearing among women of different ages within the reproductive years, and (2) as an intermediate computation in the derivation of the total fertility rate (TFR).

The Age Specific Fertility Rates (ASFRs) presented in Table 4.1 show the high fertility pattern being experienced by Uganda's adolescents and the whole population at large. The pattern observed here shows that fertility starts early and has a very broad peak. In Uganda, childbearing starts early with women aged 15 – 19 years old having a rate as high as 0.160 literally meaning that for every 1,000 females aged 15-19, they have 160 births. When childbearing starts early, women are less likely to complete their education making it very difficult for them to develop careers later in life. The high levels of ASFRs imply that there is lack or limited attempts to control child bearing (Family Planning).

The results further indicate that the ASFR is higher for rural adolescents compared to their urban counterparts (0.178 compared with 0.120 respectively). The rate decreases with higher educational attainment. By sub-region break down, the rate is higher for the adolescents in Busoga and Bukedi sub-regions and lowest in Kampala district.

4.2. Female population aged 13-19 years who have ever given birth

Teenage pregnancy and motherhood has remained a major health and social concern in Uganda because of its association with higher morbidity and mortality for both the mother and child. In addition to the physiological risks, there is a negative effect on the socioeconomic status of the mother, and hence the child, because most of the schools' current school policy is to have pregnant girls terminate their education.

Table 4.2 shows that out of the 3.0 million females aged 13 to 19 years, 17 percent had already begun child bearing with at least one birth. The findings show that rural teenagers start parenthood slightly earlier than their urban counterparts (18 percent versus 16 percent, respectively). Among the teenagers who have never married, eight percent had ever had child birth while for the single

women (12-14 years), the proportion was four percent and rises to 46 percent for the older single youth (25-30 years).

The percentage of teenagers who have begun childbearing varies by sub-region. Bunyoro sub-region had the highest proportion (22 percent) compared with other regions, while Kigezi had the lowest (11 percent).

4.2.1. Proportions of young mothers (13-19 years) by highest level of education attained

Table 4.3 indicates that about 10 percent of the young mothers had no formal education while 71 percent had completed primary level (any class from P1 to P7). The proportion with primary education attainment was higher for rural residents compared to their urban counterparts (75 percent and 57 percent respectively). The pattern was the same for those who never attended formal education (11 percent and 7 percent respectively). In Karamoja sub-region 79 percent of young mothers had no formal education while 17 percent had primary level.

Table 4.3: Highest level of education attained by young mothers aged 13-19

Background characteristics	Highest education level attained				Total
	Never formal schooling	Primary	Secondary	Tertiary

Total	10.2	71.3	18.2	0.3	100

4.2.2. Young people and child bearing

Parity and Completed Family Size: Parity refers to the number of children previously born alive to a woman. The mean numbers of children ever born by adolescents aged 13 to 19 are presented in Table 4.4. The table shows that among the adolescents aged 13 to 19 years, 17 percent had already had at least a child, with slightly higher proportion for rural teenagers (18 percent) as compared to their urban counterparts (15 percent). Three percent had already had two children. Comparisons by regions indicate that the proportion of teenagers with at a child was highest in Bunyoro (22 percent) and lowest in Kampala and Karamoja (14 percent respectively). The mean number of Children Ever Born (MCEB) for teenagers aged 13 – 19 was 1.2, with small variations by residence and regions.

Table 4.4: Mean children ever born by teenagers (13-19 years)

Background characteristics	Number of children ever born					Total	MCEB
	0	1	2	3	4

4.3. Young people and disability

In order to enhance inclusive growth and development, one of the strategies in the second National Development Plan that targets Persons with a Disability (PWD) is geared towards equalization of opportunities, rehabilitation and inclusion of PWDs in their communities. The current Government strategy towards interventions of PWDs is through the Community Based Rehabilitation Programme.

Persons with disabilities are considered vulnerable in Uganda. They are disadvantaged in work places and in other public places. The government of Uganda has developed a National Disability Policy to promote effective service delivery to persons with disabilities. Recently, the Expanding Social Protection Programme (ESP) was developed primarily to incorporate a national social protection system, including direct income support for the poorest and most vulnerable people, a population that includes those with disabilities.

There are different ways of measuring disability. In this report, the Washington Group set of questions were used to identify persons with disability in order to measure equalization of opportunities. The set of questions included seeing, hearing, walking or climbing steps, and remembering or concentrating. Information was collected on each household member aged 2

years and older about whether he or she had difficulties with seeing, hearing, walking or climbing stairs, and remembering or concentrating.

Overall, disability prevalence rate was seven percent for the adolescents aged 10-19 years and nine percent for the youth (18-30) as shown in Table 4.5. The results thus reveal that the prevalence of disability increases with age which may be associated with longer time of exposure to the risks. Sex differentials reveal that disability is slightly higher among females compared to males. The disability prevalence rate was higher for rural residents than for urban residents irrespective of the age group. The findings further reveal that the disability rates were highest in Lango and Acholi sub-regions compared to other sub-regions irrespective of the age group.

Table 4.5: Proportion of young persons with disability by sex, residence and sub-regions

Total	7.0	8.6	7.3	7.0	7.5	9.0

4.3.1. Number of young people (10-29 years) with disability, by degree

During data collection, responses to the questions used to identify persons with disability were (1) No difficulty; (2) Yes – some difficulty; (3) “Yes – a lot of difficulty”; and (4) “Cannot do at all. In the tabulation of results, the responses were grouped into two categories, namely, some difficulty that includes code 2 and severe difficulty that included codes 3 and 4.

The results in Table 4.6 indicate the number of disabled persons by age groups and the severity of the disability. The results indicate that overall, about 13 percent and 12 percent of the disabled adolescents and youth had severe disability respectively. By sub-regional disaggregation, Central1 had the highest proportion of persons with severe disability irrespective of the age group.

Table 4.6: Number of young people with severe and some disability, by sub-regions

Regions	10-19			18-30			15-24

4.4. Youth friendly Services in Communities

Youth friendly services are a pinnacle to the development aspirations of a youthful country such as Uganda. These services also position the youth on the pathways to realize a demographic dividend for themselves, their families and country at large. It is therefore of paramount importance that each of the government programs and policies are tailored to cater for the needs of the youth in a simplistic, digestible and youth friendly tone. Appellations used by multimedia corporations may lend a good leaf to the design and formulation of what would be termed as youth friendly services.

Such services are usually provided in;

- i. Health centres (e.g. Marie Stoppes, Health Centres II, III, IV and V),
- ii. Youth Centres. A Youth Center is a social and recreational center intended primarily for use by children ages 11 to 18 years. The Center supports opportunities for youth to develop their physical, social, emotional, and cognitive abilities and to experience achievement, leadership, enjoyment, friendship, and recognition.
- iii. Schools or within the community.

During the 2014 Census, information was collected from a selected set of youth friendly services. The results in table 4.7 highlight the proportion of selected youth friendly services available in the communities. The results indicate that most of the selected youth friendly services were not readily available in the communities. About 11 percent of the communities reported availability of counselling services within their communities. The counselling services were more available in Kampala communities (22 percent) and least available in Lango sub-region at five percent.

Table 4.7: Availability of Youth friendly services in communities by residence and region

CHAPTER FIVE:

EDUCATIONAL ATTAINMENT, PROGRESSION AND LITERACY OF YOUNG PEOPLE

Key Findings

The P5-P7 Gross Enrolment Rate (GER) for Uganda was at 102.6 percent, and was slightly higher for females (105 percent) compared to males (100.5 percent). Schooling at an age above the official age was more pronounced in the Acholi sub-region (122.1 percent) compared to other sub-regions and lowest in Karamoja sub-region (38 percent).

The P5 to P7 Net Enrolment Ratio (NER) for Uganda was 33.7 percent, and was higher for females (36 percent) than males (31 percent). Urban areas had a higher P5 to P7 NER (48 percent) compared to rural areas (30 percent). Kampala (61 percent) sub-region had the highest P5 to P7 NER while Karamoja sub-region (12 percent) had the lowest.

The Secondary School Net Enrolment Ratio was 32, with urban areas having higher Secondary School NER of 46 percent compared to rural areas (28 percent). Variations by sub-region indicate that Kampala sub-region (57 percent) had the highest secondary school NER while Karamoja had the lowest (13 percent).

Tertiary institutions Gross Enrolment Ratio was 15 percent, which was higher for males than females (19 percent and 12 percent respectively). Urban areas (26 percent) had a higher tertiary institutions GER than rural areas (10 percent); while Bunyoro sub-region registered the lowest GER of 8 percent compared to other regions.

Education develops a country's economy and society; therefore, it is a key milestone of a nation's development. Education provides knowledge and skills to the population, as well as shaping the personality of the youth of a nation. Education is very important for an individual's success in life. Education is generally seen as the foundation of society which brings economic wealth, social prosperity and political stability. The economic and social status of the population depends on education obtained by individual since education contributes to individual capability in managing quality of life. Education in society prepares young people for adulthood as the next generation of leaders.

Educational attainment is an important indicator of the society's stock of human capital and level of socioeconomic development and refers to the highest level of education that an individual has completed.

5.5. Enrolment Rates and Gender Parity Index of School Going Young Persons

Gross Enrolment Ratio (GER) is widely used to show the participation in a given level of education. It indicates the capacity of the education system to enrol students of the official school-going-age group. For instance, if it is more than 100, it implies that the system enrolls pupils/students outside the official school-age. The official P5 to P7 school-going-age for Uganda is 10 to 12 years while the official secondary school-going-age is 13 to 18 years. On the other hand, the Net Enrolment Ratio (NER) shows the level of participation and share of children of official school-going-age that is actually enrolled in a particular level of education.

5.1.1. Enrolment Rates 12-13 years in P5 to P7

Table 5.1 presents the Primary School GER and NER for the persons aged 10-12 because it is the right age for enrolment P5 to P7 and that age group fall within young persons. The findings show that the P5-P7 GER for Uganda was at 102.6 percent. The GER for girls was slightly higher than that of boys (105 percent and 101 percent respectively). Schooling at an age above the official age was more pronounced in the Acholi (122 percent) compared to other sub-regions and lowest in Karamoja sub-region (38 percent).

The P5 to P7 Net Enrolment Ratio for Uganda was 34 percent. The NER was higher for females (36 percent) than males (31 percent). Urban areas had a higher P5 to P7 NER (48 percent) compared to rural areas (30 percent). Furthermore, Kampala (61 percent) sub-region had the highest P5 to P7 NER while Karamoja sub-region (12 percent) had the lowest.

Table 5.1: Enrolment Rates 12-13 years in P5 to P7 by background characteristics

Enrolment Primary (P5-P7)					
Background Characteristics	All ages	10-12 years	Population (10-12)	GER	NER
Sex					
Male	1,495,843	459,785	1,473,678	100.5	31.2
Female	1,538,202	527,073	1,454,757	104.6	36.2
Residence					
Urban	643,662	280,574	583,707	107.6	48.1

Teso	184,814	51,316	166,388	110.5	30.8
West Nile	220,119	51,115	244,743	89.6	20.9
Acholi	162,638	48,896	132,551	122.1	36.9
Lango	207,647	54,469	186,995	110.6	29.1
Karamoja	33,730	9,842	84,863	38.4	11.6
Tooro	198,633	55,944	211,911	93.5	26.4
Ankole	233,214	72,521	242,843	95.2	29.9
Bunyoro	157,666	49,543	164,601	95.1	30.1
Kigezi	119,977	37,430	115,664	102.8	32.4
Total	3,034,045	986,858	2,928,435	102.6	33.7

5.1.2. Enrolment Rates 13-18 years in S1 to S6

Table 5.2 presents the Secondary School Gross and Net Enrolment Ratios from the NPHC 2014. Secondary School Gross Enrolment Ratio in Uganda was 45 percent. The GER for males was slightly higher than that of females (47 percent and 42 percent respectively). Rural-urban and regional variations reveal that urban areas (62 percent) had a higher Secondary School GER than rural areas (39 percent); while Karamoja sub-region (20 percent) registered the lowest GER compared to other regions.

The Secondary School Net Enrolment Ratio for Uganda was 32 percent during the NPHC 2014. The low Secondary School NER implies that a large proportion of secondary school-age children are not enrolled in secondary school. The rate was slightly higher for males (33 percent) than for females (32 percent). Urban areas had a higher Secondary School NER (46 percent) compared to rural areas (28 percent). Variations by sub-region indicate that Kampala sub-region (57 percent) had the highest secondary school NER while Karamoja had the lowest (13 percent).

Table 5.2: Enrolment Rates 13-19 years in Secondary (S1 to S6) by background characteristics

Secondary school enrolment (S1-S6)					
Background characteristics	All ages	13-18 years	Population (13-19)	GER	NER
Sex					
Male	1,188,123	826,568	2,525,755	47.0	32.7
Female	1,094,439	820,806	2,600,276	42.1	31.6

Karamoja	27,215	18,450	137,931	19.7	13.4
Tooro	139,324	97,813	367,206	37.9	26.6
Ankole	194,562	138,932	420,882	46.2	33.0
Bunyoro	93,867	69,079	282,785	33.2	24.4
Kigezi	98,398	70,359	207,452	47.4	33.9
Total	2,282,562	1,647,374	5,126,031	44.5	32.1

5.1.3. Enrolment Rates 19-24 years in Tertiary

Table 5.3 presents the tertiary institutions' Gross and Net Enrolment Ratios from NPHC 2014. Tertiary institutions Gross Enrolment Ratio in Uganda was 15 percent. The GER for males was higher than that of females (19 percent and 12 percent respectively). Rural-urban and regional variations reveal that urban areas (26 percent) had a higher tertiary institutions GER than rural areas (10 percent); while Bunyoro region (8 percent) registered the lowest GER compared to other regions.

The tertiary institutions Net Enrolment Ratio for Uganda was 10 percent during the NPHC 2014. The low tertiary institutions NER implies that a large proportion of tertiary institutions age children are not enrolled in tertiary institutions. The rate was higher for males (12 percent) than for females (8 percent). Urban areas had a higher tertiary institutions NER (17 percent) compared to rural areas (8 percent). Variations by sub-region indicate that Kampala sub-region (27 percent) had the highest tertiary institutions NER while Bunyoro and Karamoja sub-regions had the lowest (5 percent each).

Table 5.3: Enrolment Rates 19-24 years in tertiary institutions

Tertiary enrolment					
Background characteristics	All ages	19-24 years	Population (19-24)	GER	NER
Sex					
Male	322,979	204,735	1,677,991	19.2	12.2

Total	570,077	363,147	3,740,440	15.2	9.7

5.6. Gender Parity Index

The Gender Parity Index measures progress towards elimination of gender imbalances in education participation and or available of learning opportunities to women in relation to those available to men. It also reflects the level of women's empowerment in society. A GPI equal to 100 indicates equality between females and males; a value less than 100 indicates inequality in favour of males while a value greater than 100 indicates inequality in favour of females.

5.2.1. Gender Parity Index for P5 to P7

Table 5.4 presents the GPI for P5 to P7 enrolment. The results reveal that overall, the GPI was slightly greater than 100 i.e. (102.8 percent) indicating that the GPI slightly favours females in P5 to P7. The results further indicate that the GPI for P5 to P7 enrolment favoured more females in urban areas compared to their rural counterparts (110.6 percent and 100.8 percent respectively). It should also be noted that the GPI for P5 to P7 enrolment greatly favoured females in Kampala (113.6 percent) while it greatly favoured males in Karamoja sub-region (83.3 percent)

Table 5.4: P5 to P7 Gender Parity Index by background characteristics

Background Characteristics	P5 to P7 Enrolment			GPI
	Male	Female	Total	
Residence				
Urban	305,564	338,098	643,662	110.6

Total	1,495,843	1,538,202	3,034,045	102.8

5.2.2. Gender Parity Index for Secondary (S1 to S6)

Table 5.5 presents the GPI for Secondary enrolment. The results reveal that overall, the GPI was less than 100 i.e. (92.1 percent) indicating that the GPI favours males in secondary. The results further indicate that the GPI for secondary enrolment favoured females in urban (110.8 percent) and males in rural areas (84.3 percent). It should also be noted that the GPI for secondary enrolment greatly favoured females in Kampala (122.0 percent), while in West Nile and Karamoja sub regions (72 percent each) enrolment favoured males.

Table 5.5: Secondary (S1 to S6) Gender Parity Index by background characteristics

Background characteristics	Secondary enrolment (S1 to S6)			GPI
	Male	Female	Total	
Residence				
Urban	349,968	387,915	737,883	110.8
Rural	838,155	706,524	1,544,679	84.3
Sub-regions				
Kampala	65,868	80,364	146,232	122.0

Total	1,188,123	1,094,439	2,282,562	92.1

5.2.3. Gender Parity Index for tertiary institutions

Table 5.6 presents the GPI for tertiary institutions enrolment. The results reveal that overall, the GPI was less than 100 i.e. (76 percent) indicating that the GPI favours males in tertiary institutions. It is worth noting that GPI for tertiary institutions enrolment favours males irrespective of residence and across all sub-regions. The results further indicate that the GPI for tertiary institutions enrolment favoured more males in rural areas (62 percent) than in urban areas (92 percent). Further, the GPI for tertiary institutions enrolment greatly favoured males in Bukedi sub-region (52 percent), compared to other regions, and there was almost equality in enrolment in Central1 (100 percent).

Table 5.6: Tertiary institutions Gender Parity Index by background characteristics

Tertiary institutions Enrolment				
Background characteristics	Male	Female	Total	GPI
Residence

5.7. School attendance status of adolescents and youths by selected characteristics

Information on the schooling status of all household members aged 5 years and above was collected during the census. This section focuses on the schooling status of persons aged 6 to 24 years because the official school going age for primary education is 6 to 12 years; secondary is 13 to 18 years and post-secondary education is 19 to 24 years.

Table 5.7 shows the distribution of the adolescents (10-19 years) and youth (18-30 years) by current schooling status. Overall, four percent of the adolescents had never attended school while 77 percent were attending school. On the other hand, eight percent of the youth had never attended school while 17 percent were attending school.

The proportion attending school was higher for males compared to their female counterparts irrespective of age groups. The results further indicate overall the proportion attending school was higher for urban residents compared to their rural counterparts irrespective of age groups. The proportion that had never attended school was highest in Karamoja irrespective of age groups,

and lowest in Kampala. The proportion currently attending school decreased with increase in age.

Table 5.7: School attendance status of adolescents and youths in 2014 by selected characteristics

5.8. Young persons, adolescents and youth literacy

Literacy is the ability for one to read with understanding and to write a simple sentence meaningfully in any language. Literacy leads to an increase in opportunities for an individual since they are able to read and write.

Figure 5.1 shows the literacy rates for young persons, adolescents and youth. Overall, the literacy rate was 78 percent for adolescents aged 10 to 19 years and 81 percent for the youth aged 18-30 years.

Figure 5.1: Literacy rates of young people by age group

The results further indicate that literacy rates were higher in urban areas compared to rural areas irrespective of age groups. There was no notable difference in the literacy rates by gender for young persons aged 10-24 while the literacy rates were higher among male youths aged 18-30 compared to their female counterparts. By sub-regions, Kampala had the highest literacy rates while Karamoja had the lowest irrespective of age groups.

Table 5.8: Young persons, adolescents and youth literacy rates by sex and age groups

5.9. Young persons by highest grade completed

Education is an essential skill required for an individual's personal and social growth. Through education, young people: become economically independent which is pertinent for national economic growth. Further, youths are able to adapt to newer techniques of production, increase their employability potential, among others. The Government of Uganda introduced the Universal Primary Education (UPE) in 1997 and Universal Secondary Education (USE) in 2007 to ensure that all children of school going age (especially those from poor backgrounds) are provided with free primary and secondary education (MoES, 2013).

During the census, household members were asked to report on their highest level of class/grade completed for those in and out of school. The analysis in Table 5.9 includes those who were not attending school in 2014. Young people who attained pre-primary education but never continued as well as those who continued but never completed Primary one were considered as Never Attended formal education.

Overall, 75 percent of the adolescents aged 10 to 19 years had attained primary education as shown in Table 5.9. The proportion was 46 percent for the youth aged 18-30. The results further indicate that there was almost no difference between girls and boys who completed primary education for adolescents but more girls than boys completed primary among the youth. Overall the share of female youth who had secondary level education was lower than the share of boys. The proportion of rural youth with no formal education was more than twice that of their urban counterparts. On the other hand, the proportion of urban youths with secondary education and above was higher than the proportion for rural youths.

By sub-region, Karamoja had the highest proportion of young people with no formal education compared to other sub-regions irrespective of the age groups. Kampala had the highest proportion of the youth (18-30 years) with education level attained of degree and above. This is partly due to migration for better employment opportunities by youths to other parts of the country.

CHAPTER SIX:

ECONOMIC ACTIVITY STATUS OF YOUNG PEOPLE

The proportions of the working adolescents and youth were 47 percent and 78 percent respectively. The proportion of working males irrespective of any selected age group was higher than that of their female counterparts. The highest proportion of young workers in Uganda irrespective of age group were own account workers (73 percent for adolescents and 72 percent for youth).

More than two thirds (68 percent) of the working adolescents and 59 percent of the working youth were subsistence agricultural workers. This was followed by service workers for each selected age group. Professionals, technicians and associate professional workers constituted four percent of the working youth.

The level of education of the working youths was generally low with almost two-thirds (66 percent) of youth having either no formal or primary level education.

Thirteen percent of the youth were neither in employment nor education/training (NEET) i.e. idle. The proportion for female idle youth nearly doubled that of the male counterparts.

6.1. Introduction

The second National Development Plan (NDPII) aims to propel the country towards middle income status by 2020 through strengthening the country's competitiveness for sustainable wealth creation, decent employment and inclusive growth. In order to achieve these objectives, one of the development strategies the Government is pursuing includes a decent employment creation strategy through fast tracking skills development and harnessing the demographic dividend.

According to the National Employment Policy for Uganda, employment creation is central to the national socioeconomic development process. It is at the core of the transformation of Uganda from a poor agrarian economy to a modern, prosperous and skilled society. It is also reflected in the objectives of National Development Plan which is enhancing the availability and quality of gainful employment. Government plans, through this policy, to translate these aspirations into action.

6.2. Working status of the young population

Youth unemployment and situations in which young people give up on the job search or work under inadequate conditions incur costs to the economy, to society and to the individual and their family. A lack of decent work, if experienced at an early age, threatens to compromise a person's future employment prospects and frequently leads to unsuitable labour behaviour patterns that last a lifetime. There is a demonstrated link between youth unemployment and social exclusion. An inability to find employment creates a sense of uselessness and idleness among young people that can lead to increased crime, mental health problems, violence, conflicts and drug taking. The most obvious gains then, in making the most of the productive potential of youth and ensuring the availability of decent employment opportunities for youth, are the personal gains to the young people themselves.

Economic activity refers to work people do to enhance their quality of life. This involves production of goods and services for sale or own consumption. Information was collected on economic activity for persons aged 10 years and above. Information on economic activity is classified into two broad categories, working and non-working population. The working persons consisted of persons who worked for pay, profit or family gain and those persons who had work but were temporarily absent from it during the reference week. The population that was not working combined two other categories of activity status (the unemployed and the not economically active population). The non-working population could not be split into the unemployed and the inactive because a population census is not suitable to provide for the split.

The proportion of the working population in relation to the total population in that age group is also referred to as the Employment to Population Ratio (EPR). The employment to population ratio (EPR) provides a good indication of the degree to which the economy is using its key productive labour resource.

Considering the selected age groups of young persons, the highest proportion of the Employment to Population Ratio was among the youth aged 18-30 (78 percent) and lowest among the young persons aged 10-19 (47 percent). The proportion of males working irrespective of any selected age group was higher than that of their female counterparts. This implies that males were found to be partly more active in the labour market than their female counterparts. The results further reveal that the EPR was higher among persons in rural areas implying greater potential and more active involvement by the people in the rural areas compared to those in the urban areas irrespective of any selected age group. Irrespective of the age groups, the highest proportion of the working young people was found in Bunyoro sub-region and lowest in Kampala.

Table 6.1: Proportion of the working population by selected age groups, sex and residence

6.3. Young people employment status

Table 6.3 shows that the highest proportion of young workers in Uganda irrespective of age group in 2014 were own account workers (73 percent and 72 percent for adolescents and youth respectively). This was followed by paid employees i.e. wage and salaried workers (18 percent and 24 percent for adolescents and youth respectively). The proportion of contributing family workers was higher for adolescent (six percent) compared to the youth (two percent)

Table 6.2: Employment status of the working young

	10-19	18-30	10-24	15-24	15-35
Paid employee	18.3	24.1	20.5	21.8	23.0

Others	2.6	1.9	2.3	2.0	2.0
Total	100	100	100	100	100
% in vulnerable employment	79.1	74.0	77.2	76.2	75.0

6.3.1. Proportion of working young population in vulnerable employment

The workforce in vulnerable employment is the sum of own-account workers and contributing family workers. Vulnerable employment is often characterized by inadequate earnings, low productivity and difficult conditions of work that undermine workers' fundamental rights. About three quarters (74-79 percent) of young workers in Uganda irrespective of age groups were classified as "in vulnerable employment".

The results in Table 6.3 indicate that overall, the proportion of young persons in vulnerable employment was 79 percent and 74 percent for the adolescents and youth respectively. The proportion of young female workers in vulnerable employment was lower than that of their male counterparts for adolescents but higher for the youth. As young people grow older, the gap between the proportion of vulnerable males and females become wider. Similarly, the proportion of young persons in vulnerable employment was lower in urban areas compared to that of their rural counterparts for all selected age groups.

Working young persons in Teso sub-region were more likely to be involved in vulnerable employment compared to their counterparts in the other sub-regions irrespective of age groups. The incidence of vulnerable employment was least prevalent in Kampala irrespective of the selected age groups.

6.4. Main occupations held by young people in urban and rural areas

Occupation refers to the kind of work an individual does irrespective of the qualification or place of work. In this report, information on occupation for the working young persons was classified using ISCO-2008. Table 6.4 indicates that more than two thirds (68 percent) of the adolescents and 59 percent of the youth were working as subsistence agricultural workers. This was followed by service workers for each selected age group. Professionals, technicians and associate professional workers were less than 1 percent for adolescents and four percent for the youth working. The proportion of domestic helpers among the adolescents was three times more than that among the youth.

Table 6.4: Percentage distribution of the young working population by occupation and age group

Occupations	10-19	18-30	10-24	15-24	15-35
Professionals	0.2	2.4	0.9	1.3	2.3
Technicians and associate professionals	0.1	1.4	0.5	0.7	1.3

Others	5.8	6.4	6.0	5.9	6.3
Total	100	100	100	100	100

6.4.1. Occupations of young people by sex and residence

Findings in Table 6.5 show that there were more female youth workers in agriculture (64 percent) than males (54 percent). Similarly, there were more female youth working as sales and service workers (12 percent) than males (eight percent). The proportion among employed youth males in elementary occupations (occupations which do not require any skills) was about twice that of females. The results further indicate that the craft and related workers were dominated by males, more than four times that of the working females.

The occupation with the highest share of employment among the rural youth (18-30 years) was the agricultural workers ((73 percent), whereas the sales and service workers was the highest for urban youth (23 percent).

Table 6.5: Occupations of young people by sex and residence

Total	100	100	100	100	100	100	100	100	100	100

Occupation by single years is provided in Appendix Tables 8.

6.4.2. Share of young women (female participation in labor market) by Occupations in rural and urban areas

This section presents gender differentials in the occupation of working young people examining the roles that females and males play in the labour market. The indicator suggests the extent to which labour markets are open to women. This indicator is used to monitor the country's progress towards MDG3 (promote gender equality and empower women).

Table 6.6 indicate that overall, about 53 percent of the working youth (18-30 years) were females. The female share of working youth was slightly higher in rural youth at 54 percent compared to urban youth at 52 percent. The female share of working youth was higher for professionals, technicians and associate professionals, clerical support workers, sales and service workers, subsistence agriculture worker, and domestic workers.

Seventy six percent of the youth working as domestic workers were females. The high share of females as domestic workers poses a challenge to exploitation as they are vulnerable and work for long hours with little negotiating powers for their welfare.

Table 6.6: Share of working young women by occupation

Occupation	18-30			15-24			15-35		
	Urban	Rural	Total	Urban	Rural	Total	Urban	Rural	Total

Others	49.6	47.6	48.6	50.8	47.2	48.5	48.8	46.8	47.7
Total	51.5	53.5	53.0	53.8	52.2	52.5	50.9	52.5	52.1

6.5. Working youth education levels

Results in Table 6.7 indicate that the level of education of the working youths was generally low with almost two-thirds (66 percent) of youth having either no formal or primary level education. The proportion adolescents (10-19 years) having either no formal or primary level education was 87 percent. The proportion for youth was higher for females (69 percent) compared to their male counterparts (63 percent). The findings further reveal that the rural working youth were less educated than their urban counterparts, with 75 percent of rural working youth with either no formal or primary level education compared to 42 percent among urban youths. Regional comparison showed that 74 percent of the working youth (18-30 years) and 89 percent of the working adolescents in Karamoja sub-region had never attended formal training compared to three percent and five percent respectively for Kampala.

6.6. Major economic activity among the youth (18 - 30 years) in the LC1.

The census collected information about the major economic activity for the youth (18 - 30 years) in their LC1 or community. This was based on the perception of the opinion leaders in the community.

Table 6.8 shows that almost two thirds (65 percent) of the communities reported youth engagement in crop farming as their major economic activity and another 6 percent mainly engaged in animal rearing. The two activities collectively accounted for 70 percent of the communities' major economic activity of the youth.

Thirty eight percent of the communities in Kampala that their youth were mainly in paid employment as their major economic activity with another 17 percent active in different forms of trade. Less than two percent were reported to be in paid employment in the regions of Bukedi, Teso, Karamoja, Lango, Acholi and West Nile.

6.7. Young persons not working

The young persons not working consist of persons who did not work for pay, profit or family gain during the reference week preceding the census night. The population of the young persons not working includes those who were looking for work, not working and not looking for work, involved in household chores, full time students, and those who too young to work, etc.

As indicated in chapter two, the population of the youth aged 18-30 years was 7.8 million persons. The results in Table 6.9 indicate that 22 percent (1.7 million persons) of the youth aged 18-30 were not working. The proportion was higher for females (25 percent) compared to that of males (19 percent). The results further indicate that there were major differentials by residence. The proportion of urban youth was about double that of the rural youths who were not working.

There were wide variations in the proportions of young persons not working by sub-regions. The proportion was highest among the youth in Kampala (40 percent) and lowest for the youth in Lango (15 percent).

6.7.1. Education Attainment of the Non-working youth

The results in Table 6.10 indicates that the proportion of the non-working youth who never attended formal education was 14 percent. Findings further reveal that 11 percent of the non-working youth with tertiary education lived in urban areas compared to two percent in rural areas. Regional disaggregation showed that 86 percent of the non-working youth in Karamoja sub-region had no formal training compared to only five percent in Kampala. Fifteen percent of the non-working youth in Kampala had tertiary education and compared to less than one percent in Karamoja.

6.7.2. Reasons for not working

As indicated in Table 6.11, the most cited reason by the youth for not working was being full time students (34 percent). The proportion of males was double that of females. By sub-region disaggregation, the proportion of youth who were full time students was highest in Elgon (48 percent) and lowest in Karamoja at four percent.

About 33 percent of the non-working youth indicated being involved in household chores as the reason for not working. These chores include cooking, fetching water, washing utensils and clothes, cleaning the house and compound, among others. The proportion of female youth not engaged in any work due to household chores was almost three times that of the males.

Table 6.11: Distribution of non-working youth by reasons for not working and selected characteristics

Note: Others include those who were not working and not looking for work, too young to work, and others

6.8. Young people neither in work nor in education (idle youth)

Ideally, every young person (at least below 25 years) is expected to be in school. However, the census data revealed that some young population were Neither in Employment nor Education Training (NEET). The share of young people who were Neither in Employment nor Education/Training captures the non-utilized labour potential of the youthful population sometimes referred to as 'idle youth'. It includes young people who are unemployed as well as those who were inactive for reasons other than participation in education. Thus, it includes discouraged workers and persons who were inactive for other reasons such as disability, engagement in household duties, and unemployed.

The results in Table 6.12 shows that out of the 7.8 million youth population (18-30 years), 962,339 of them (13 percent) were neither in employment nor education/training (NEET). The proportion for female youth who were neither in employment nor education/training was nearly double that of their male counterparts. There also existed variations in the indicator by residence, where the proportion was higher in urban areas (19 percent) than in rural areas (10 percent).

The results further indicate that the level of idleness among youth aged 18-30 years was highest in Karamoja sub-region at 28 percent and lowest in Bunyoro sub-region at 7 percent. There also exists variations in the levels of idleness of other age groups by different sub-regions.

6.9. Ownership of agricultural land

Household assets are a proxy indicator for the socio economic status and welfare of the household. Ownership of Assets refers to personal property irrespective of the purpose it serves. Any asset owned by any member of the household was treated as a household asset during the census. Among these assets was land.

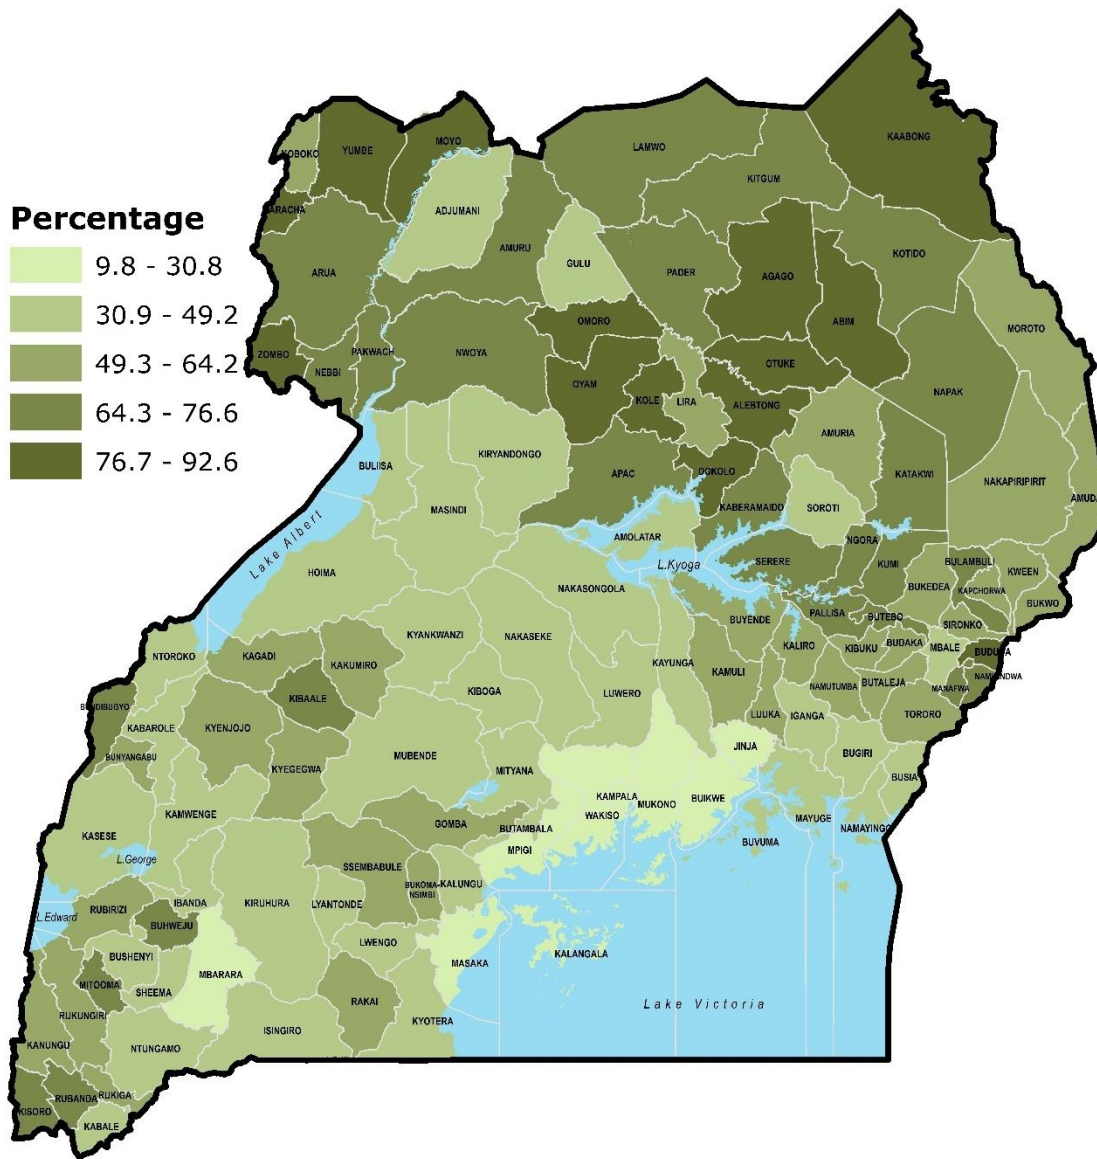

Overall about one half (51 percent) of the youth aged 18-30 heading households owned agricultural land as indicated in table 6.12. The proportion of male youths (54 percent) was higher than that of the females (33 percent). The ownership of agricultural land by rural youth aged 18-30 (65 percent) was higher than that their urban counterparts (24 percent). By sub-region, West

Nile and Lango sub-regions had the highest proportion of youth headed households owning agricultural land at 78 percent compared to other sub-regions. Kampala had the lowest ownership of land by youth headed households at 13 percent.

CHAPTER SEVEN:

ACCESS TO ICT BY YOUNG PEOPLE

Key Findings

More than one half (53 percent) of the youth (18-30 years) owned a mobile phone. The proportion of males (63 percent) was higher than that of females (46 percent) across all age groups.

Overall, fifteen percent of the youth age 18-30 used internet. Among the youth, the proportion of males (19 percent) using internet was higher than that of their female (11 percent) counterparts. The proportion of urban youth who used the internet was almost thrice that of rural residents regardless of the selected age group.

Only five percent of the youth aged 18-30 heading households reported any of the household members owning desktop or laptop computers. Kampala sub-region had the highest proportion of ownership of desktop and laptop computers by any household member across all age groups.

Access to information does not define itself only in terms of access to different technologies and media, but must take into account the nature and type of information young people need for full participation in society. The ICT sector is envisaged to facilitate sustainable, effective and efficient development through harnessing its utilizing in all spheres of life. It is composed of telecommunications, postal, information technology (IT), and broadcasting subsectors.

Over the years, government has put in place an enabling environment that has enabled the ICT sector grow at a cumulative annual growth rate of over 25 percent. Significant growth is seen in areas of mobile devices, computer applications, information processing, storage and dissemination as well as mobile finance, e-finance, global connectivity and online trade. The sector has registered significant progress in the area of access to ICT infrastructure and its usage. The sector targets to increase its contribution to Government revenue from 8.1 percent in 2012/13 to 10 percent in 2020 and increase employment in the ICT sector from 1 million to 3 million people in 2020.¹

¹NDP II

It is clear that the greater the range of modes of access to Information, Communication and Technology (ICT) available, the more accessible services will be to young people. However, the available evidence from the 2014 NPHC regarding access to ICT raises a number of issues for service providers and planners to consider.

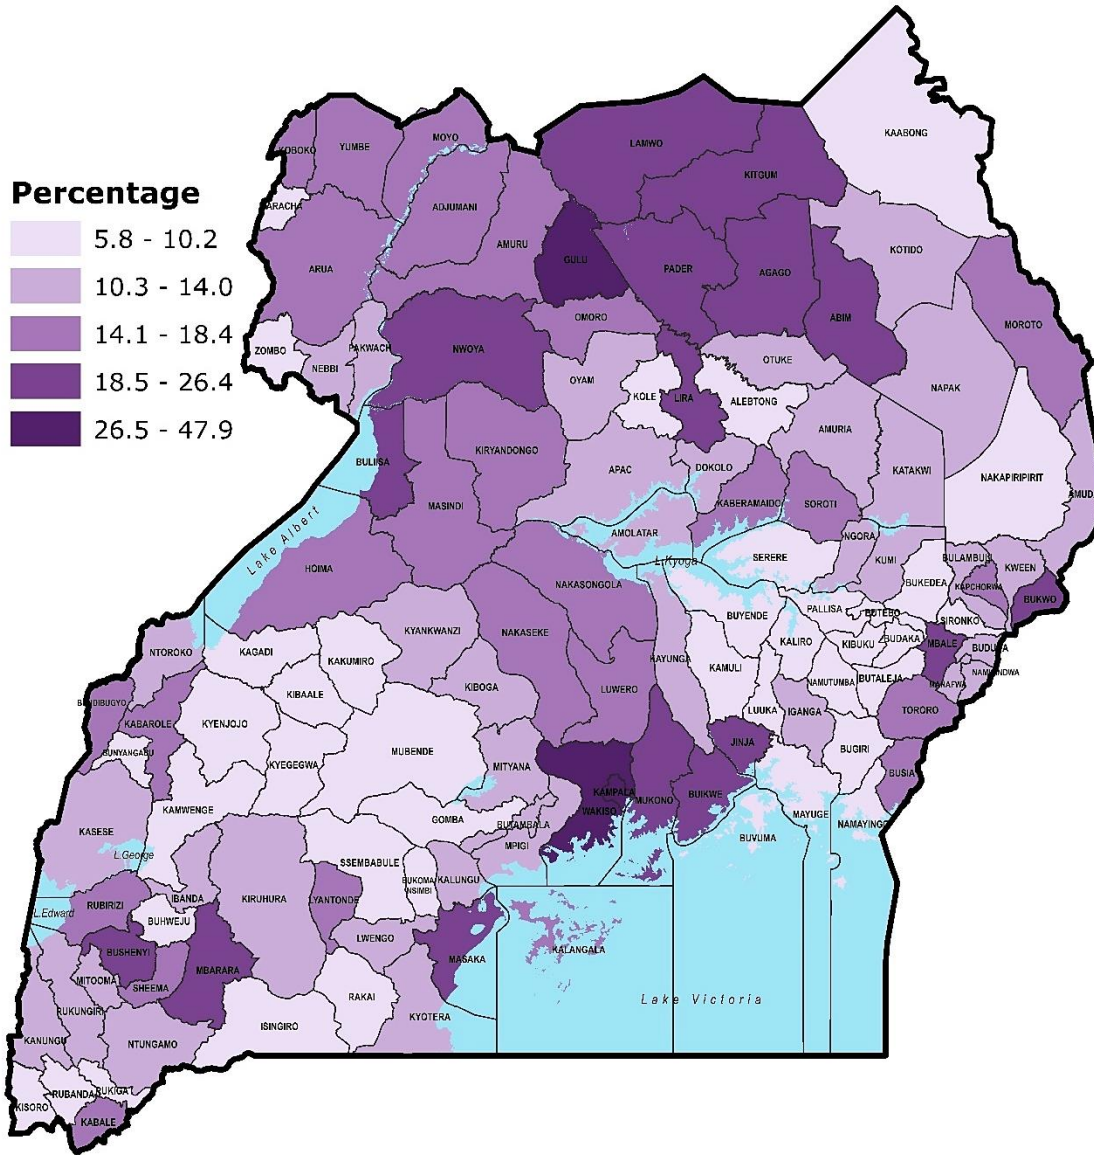

7.1. Mobile Phone Ownership among young people

Results in Table 7.1 indicate that nationally, more than one half (53 percent) of the youth aged 18-30 years owned a mobile phone. The proportion varied by age groups, with percentage of males (63 percent) owning mobile phones being higher than for females (46 percent). Similarly, urban residents owned nearly double mobile phones than rural residents regardless of selected age groups. Ownership of mobile phones was highest in Kampala (88.7 percent) and lowest in Karamoja (19.5 percent) sub-region.

Map 7.1: Map showing internet usage by the youth (18-30 years)

See Appendix Table 10 for internet usage by the youth (18-30 years) by Districts

7.2. Internet use among the young people

The results in Table 7.2 indicate that nationally, about 15 percent of the youth (18-30) used internet. For all the selected age groups of the young population, the proportion of males using internet was higher than that of their female counterparts. The proportion of urban residents who used internet was almost thrice that of rural residents regardless of the selected age group. Among the sub regions, the highest usage of internet was reported in Kampala (47 percent) while Karamoja had the least with only eight percent.

7.3. Ownership of Other ICT (Desktop and Laptop Computers)

About five percent of the youth aged 18-30 heading households reported a family member owning desktop or laptop computers. The proportion was similar by sex. The ownership of households desktop or laptop computers by the urban youth (18-30 years) was almost five times that of their rural counterparts (24 percent). By sub-region, Kampala had the highest proportion of youth heading households owning a desktop or laptop computers (10 percent) compared to other sub-regions.

CHAPTER EIGHT:

POLICY FRAMEWORK, POLICY IMPLICATIONS AND CONCLUSIONS

8.1. Policy Framework

With the National Vision 2040, Uganda aspires to reach the upper middle income by 2040. With this aspiration, the country has put in a place a number of policies, strategies and plans that are hinge don international frameworks to achieve unity in diversity and equal opportunities for the general population. With 78 percent of the population being 30 years and below, the aspirations of young people must be properly guided for Uganda to achieve its national vision.

8.1.1. The National Youth Policy

In line with the strategic objective of fast-tracking pathways of attaining a demographic dividend from her majorly young population, Uganda recently launched the National Youth Policy 2016.

As clearly articulated in the policy, the lives of millions of Ugandan Youth are marred by poverty, inadequate education and skills, inadequate work/employment opportunities, exploitation, diseases, civil unrest and gender discrimination. The environment they live in brings both new possibilities and new risks that undermine the traditional social support that helps the Youth prepare for, negotiate and explore the opportunities and demands of their passage to adulthood. This thus illustrates an appreciation of the needs of the youth in the hearts and minds of the framers of the policy.

The policy is framed against a vision to ensure a moment when all Youth of Uganda are nurtured, protected, educated, equipped with skills and economically, politically and socially empowered. It is the country's aspiration to see the youths gainfully employed and actively participating in socio-economic development.

8.1.2. Sustainable Development Goals about the young people

In adopting the 2030 Agenda for Sustainable Development, world leaders agreed on a set of 17 goals and 169 targets with the aim to improve the lives and future prospects of everyone, everywhere. This provided a continuation to the Millennium Development Goals (MDGs) whose timelines elapsed in 2015. These Sustainable Development Goals (SDGs) touch a multiplicity of key result areas for the betterment of mankind. They were formed at UN General Assembly in Rio de Janeiro in Brazil where all the 193 UN member states took part and assented to adopt them in their respective countries. Uganda was one of the UN member states whose head of state attended. A closer scrutiny of the 17 goals and 169 targets points at an aspiration by the United Nations to realize a demographic dividend in all its 193 member states. All the goals ranging from ending poverty to environmental conservation were formulated with a target linked to empowering the youth.

Although all goals and targets were formed in the interest of all persons, there are notable goals of greater interest and focus to the empowerment and development of the youth. Among such goals is the goal on poverty, hunger, gender equality, education, clean water and sanitation, decent work, innovation, reduced inequalities, peace and justice that directly capture the plight of the youth with targets that delve into the catchy issues that youths in the developing countries commonly encounter.

Policy Implications

Despite the progress made in addressing issues of young people, the rate at which the population of young people is growing is not in tandem with strategic investments for improving the quality of this population. High teenage pregnancy of 25 percent (UDHS, 2016) has contributed to high fertility (5.4 children per woman). This has contributed to high population growth rate of three percent. High teenage pregnancy has also led to high school drop-out rate for girls with some schools registering as low as five percent completion rate. Young people in Uganda especially girls are disproportionately vulnerable to a number of challenges including among others, Sexual and Reproductive Health (SRH), poverty and gender discrimination that hinder them from realizing their full potential.

The 2014 census results clearly point out the other major challenge the young people are faced with, which is the scramble for resources and opportunities. This is reflected by the 78 percent proportion of the young population aged 30 years and below and 23 percent of the population aged 18 to 30 years. The resources and opportunities are not only scanty but also not in reach for majority of the young people. This leaves the young people highly vulnerable on all fronts and incapacitated to realise their full potential and help themselves and their country attain a demographic dividend.

With the youth unemployment rate at 13 percent (UNHS 2016/17), an unmet need for family planning of about 30 percent (UDHS 2016), with HIV/AIDS prevalence rate of 2.1 percent among the youth (UPHIA 2016), coupled with Uganda's high fertility rate of 5.4 (UDHS 2016) leading to a growth rate of 3.0 percent, Uganda stakes slightly below the optimum for countries with aspirations of achieving all the 169 targets by 2030. These indicators have a binding on the empowerment and development of the youth and warrant that all stakeholders join hands to improve to a tune that would enable Uganda progressively remain in the pathway of realizing a demographic dividend for her people, households and as a nation.

As is widely argued, challenges of young people are most pronounced by looking at youth disguised employment or underutilisation. In Uganda, youth underutilization is reported above 30 percent yet many are released annually into the job market to compete for limited available jobs. Although the jobs are few and the youths continue to increase in number, at least going by the current growth rate of 3.0 percent, the worrying underutilisation levels point to a notable causal factor which is skills.

According to the ILO, one of the three ways to tackle youth unemployment is by the right mix of education and training which includes inculcating skills into young people that would not only improve their employability levels but also enhance their innovativeness and productivity. The Uganda government introduced universal formal education so that young people can be thoroughly trained from the age of 6 to 12 years through universal primary education and for the ages of 13-18 through universal secondary education or rather business, entrepreneurship, technical and Vocational education training. Although this may improve the young people's skills in numeracy and literacy, the lot that is churned out through these programs join with the rest of the population to compete for the limited job opportunities. However, its noteworthy that despite the introduction of the universal formal education, about 56 percent of the youth (18-30 years) had either never been to school or attained primary education. Although comparably better than the past where the literacy levels were below average and the employability levels among the youth, a lot need to be done to have all the young people acquire basic formal education.

On the health front, the youth require access to sexual and reproductive health both for their survival but also leading a life of purpose and not of chance. Teenage pregnancy and motherhood is the most serious health hazard for the female youths with 25 percent of the adolescents (15-19) having begun child bearing (UDHS 2016) yet only about 13 percent and less of the communities having related youth friendly services. To address this, more interventions and investments will be needed to extend youth friendly programs and interventions closer to the young people if the future and lives of the young people are to be secured so that the country harnesses a demographic dividend out of them.

8.2. Policy Recommendations about young people

Uganda launched the report, "Harnessing the Demographic Dividend: Accelerating Socioeconomic Transformation in Uganda" in 2014 and is currently developing the roadmap to accelerate harnessing of the Demographic Dividend. This report reflects the medium term development aspirations of the country presented in the National Development Plan (NDP) II.

One of the Development Strategies incorporated in the NDP II is harnessing the Demographic Dividend through implementing policies and programmes aimed at accelerating a rapid decline in fertility while ensuring surplus quality labour force. Uganda will have to implement policies aimed at accelerating a rapid decline in fertility and ensure the resulting surplus labour force is well educated, skilled, healthy and economically engaged in order to reap the demographic dividend. In this regard, emphasis should be put on improving access to family planning services and reforming the education system to improve quality of education critical for enhancing the level of skill and innovation of the labour force.

The opportunity to harness the demographic dividend will be lost if the right actions are not implemented for the target population in a timely and coordinated manner. Failure to have evidence based information to guide demographic dividend programming could result into stagnation of GDP per capita which may further be reflected in low economic growth, insecurity and socioeconomic backwardness resulting into a demographic burden.

APPENDIX TABLES

UGANDA BUREAU OF STATISTICS, P.O. Box 7186, Kampala, UGANDA. Tel: +256-414-706000. Fax: +256-414-237553. Email: ubos@ubos.org Website: www.ubos.org

Hello, my name is and I work with Uganda Bureau of Statistics (UBOS). We are conducting the National Population and Housing Census 2014. We are visiting each and every household in the country collecting information about individuals and the homesteads they live in. It takes about 40 minutes to complete the interview. Whatever information you provide will be kept strictly confidential. We would very much appreciate your participation and co-operation in this Census.

Result Code (R1) 1 Completed 2 Partially Completed 3 Not Interviewed	Ethnicity (P8) 511 Acholi 533 Banyaruguru 555 Kakwa 512 Aliba 534 Banyarwanda 556 Karimojong 513 Alur 535 Banyole 557 Kebu (Okebu) 514 Aringa 536 Banyoro 558 Kuku 671 Kenya 515 Baamba 537 Baruli 559 Kumam 672 Tanzania 516 Babukusu 538 Barundi 560 Lango 673 Rwanda 517 Babwisi 539 Basamia 561 Lendu 674 Burundi 518 Bafumbira 540 Basoga 562 Lugbara 675 South Sudan 519 Baganda 541 Basongora 563 Madi 676 Dem.
